

11. What is a Set?

Answer: A Set stores unique values and removes duplicate items automatically.

Real-World Example: A classroom attendance list where each student is counted only once.

12. What is the difference between = and ==?

Answer: = is used to assign a value, while == is used to compare two values.

Real-World Example: Writing your name on a notebook (=) vs checking if two notebooks have the same name (==).

13. What is input()?

Answer: input() is used to get data from the user.

Real-World Example: Filling your name in an online registration form.

14. What is print()?

Answer: print() is used to display output on the screen.

Real-World Example: Showing your exam result on a computer screen.

15. What is len()?

Answer: len() returns the number of items in an object.

Real-World Example: Counting the number of books on a shelf.
